**exinda.**

Exinda Management Center is built for organizations that need to manage network health and application performance across multiple locations. As the number of sites increases it becomes more complex to manage and maintain an efficient network. Management Center is engineered to provide busy IT professionals a central place to administer network policies and manage appliance configurations across the entire organization.

Central Policy Management

Build and apply policies across the entire network from one console. Define policies for network objects, circuits, users and applications, and roll them out to your fleet of Exinda appliances.

One-to-Many Configuration

Define and deploy Exinda appliance configurations from a multi-tenant management interface. Deploy and manage groups of appliances with common configurations and policy sets.

Unified Reporting

Select from a list of standard reports, or generate custom reports, designed to give you a integrated view of the applications, users, devices, and other activity on your network.

Faster Firmware Upgrades

Make estate-wide firmware updates faster. Connecting Management Center with Exinda Service Delivery Point makes it easy to keep all your appliances up to date from one console.
